INTRODUCTION

BACKGROUND
The California Water Code (Water Code) requires coordination between land use lead agencies and public water purveyors. The purpose of this coordination is to ensure that prudent water supply planning has been conducted, and that planned water supplies are adequate to meet both existing demands and demands of planned development.

Water Code Sections 10910 – 10915 (inclusive) require land use lead agencies: 1) to identify the responsible public water purveyor for a proposed development project, and 2) to request a “Water Supply Assessment” (WSA) from the responsible purveyor. The objective of a WSA is to demonstrate the sufficiency of a purveyor's water supplies to satisfy the water demands of a proposed development project while still meeting the current and projected water demands of existing customers. Water Code Sections 10910 – 10915 delineate specific information that must be included in a WSA.

THE PROPOSED DEVELOPMENT PROJECT
The City of Elk Grove (City) is preparing a CEQA document for the proposed project known as California Northstate University Medical Center (Project). The Project (City file #PLNG18-110) site is located in the City of Elk Grove in Sacramento County, California; the approximately 25-acre Project site is situated on the western boundary of the City, approximately 4.75 miles west of the City center and is bordered by Elk Grove Boulevard to the north, Interstate 5 to the west, West Taron Drive to the east, and the Laguna Stone Lake subdivision to the south. The area is fully developed except one approximately 0.5-acre undeveloped parcel on the southwest corner of Riparian Court and West Taron Drive.

California Northstate University (CNU) is a private educational institution that currently operates a pharmacy and medical college at 9700 West Taron Drive and an approximately 15,000-square-foot event center in the office building at 9650 West Taron Drive. The establishment of CNU at its current location was permitted via a conditional use permit (EG-11-003) approved by the City Planning Commission on March 3, 2011.

CNU is proposing to expand its facilities and services to provide emergency and other medical related services in the western portion of the City. At buildout, the Project will consist of an expanded pharmacy and medical college, medical center (hospital) with a helicopter landing pad (helistop), out-patient clinic, medical office building, two parking structures with accessory retail, a dormitory, one parking structure with roof-top sports facilities, a central plant and mechanical yard, public gathering spaces, and surface parking. The project can be broken down into several categories. 1) The hospital building would be approximately 563,500 square feet in size and 12 stories in height. The hospital would be designed to a level II trauma standard and would include approximately 250 patient beds and a helistop. 2) The central plant would be 22,000 square feet in size with the main level designed to house support equipment for the hospital and one basement floor parking level. 3) The patient bed tower would be approximately 136,500 square feet in size and include seven stories. It would be built on top of the existing Phase 1 Hospital podium starting at the fourth-floor level and would add approximately 150
patient beds for a total of 400 beds. 4) An out-patient clinic building would be 125,000 square feet in size and four stories in height. 5) The medical office building would be 123,000 square feet in size and five stories in height, and would contain outpatient medical clinics and house hospital administration. 6) The dormitory building would include approximately 150 units to house 300 students and would be located adjacent to the school facilities. The structure would be five stories in height and 172,500 square feet in size. 7) An administration expansion would expand the existing school of medicine building at 9700 West Taron Drive. The administration expansion would be three stories in height and 43,500 square feet in size. See Figure 1 for the Project location.

The City of Elk Grove has identified the Sacramento County Water Agency (SCWA) as the responsible water purveyor for the Project and has requested that SCWA prepare this WSA in accordance with Water Code Sections 10910 – 10915.

WATER SUPPLY ASSESSMENT OBJECTIVE
The objective of the California Northstate University Medical Center WSA is to demonstrate that the planned water supplies for Zone 40 of SCWA are sufficient to meet the demands of the Project in addition to the existing and projected water supply obligations over the next 20 years. The findings of this WSA will be included in the Project’s CEQA review by the City.
Figure 1  California Northstate University Medical Center Location Map
OVERVIEW OF THE California Northstate University Medical Center WSA
The Project lies entirely within the boundaries of SCWA’s Zone 40/41 service area and also inside of the 2030 Study Area of the Water Supply Master Plan (WSMP), (SCWA, 2005). Since 2005, SCWA has amended the WSMP for the following areas: Cordova Hills (approved), Jackson Township (pending approval), New Bridge (pending approval), and West Jackson (pending approval). In 2016, SCWA also developed the Water System Infrastructure Plan (WSIP) (SCWA, 2016). The WSIP is a staff-level document that describes the projected water supply infrastructure needs to meet the projected built-out water demands in Zone 40, including the Project demands. Subsequently, the 2015 Urban Water Management Plan (UWMP) was developed based on water demand and supply information provided in the WSIP. The UWMP demand projections include the estimated Project demands.

In addition to the above referenced documents, the following documents may be used in whole or in part for the water assessment for the Project:

- The Central Sacramento County Groundwater Management Plan (SCGA, February 2006);
- The Final Environmental Impact Report (FEIR) for 2002 Zone 40 Water Supply Master Plan (EDAW, December 2004);

Figure 2 shows the land use diagram of the Project provided by the City.
Water Code Sections 10910 – 10915 delineate the specific requirements of a WSA. The WSA for the Project is structured according to these requirements.

DETERMINE IF PROJECT IS SUBJECT TO CEQA [Section 10910 (a)]
The City has made the determination that the Project is subject to CEQA.

IDENTIFY RESPONSIBLE PUBLIC WATER SYSTEM [Section 10910(b)]
The City has identified SCWA as the responsible public water provider for the Project.

DETERMINE IF UWMP INCLUDES WATER DEMANDS [Section 10910(c)]
The total area for the Project is estimated to be 25 acres. The projected annual water demand for the Project is 325.7 acre-feet per year (AF/year), including system losses. The proposed land use and projected water demand for the Project is provided in Table 1.

Note: the land use information and water usage information was provided by the project proponent (Fong & Chan Architects; 1361 Bush Street, San Francisco, CA 94109) on July 8, 2019 via email.

As the Project is located in the 2030 study area of the WSMP and in the study area of the WSIP, the water demand associated with the proposed Project is accounted for in the current UWMP, which describes SCWA’s existing and projected water demands through 2040. Therefore, the UWMP will serve as the base document for preparing the WSA for the proposed Project. The water demand growth shown in the UWMP is based on the estimated gallons per capita per day (GPCD) target and the projected population growth. Establishing a GPCD target is a requirement for the UWMP in accordance with Senate Bill (SB) x7-7, adopted in November 2009, so that each purveyor would achieve 20 percent reduction in water use by 2020. The target for SCWA is determined to be 236 GPCD in the 2015 UWMP.

The projected population growth for Zone 40 was based on the estimated annual number of new connections. First, the buildout population was estimated based on the projected number of dwelling unit connections at buildout. Then the annual number of new connection was estimated. The details of population projection for Zone 40 are documented in the WSIP. The WSIP developed buildout land use acreage by type of land use, which was used to quantify the buildout number of dwelling units and water system connections. That assessment included those in the 2030 Study Area and new growth areas including Cordova Hills, Jackson Township, New Bridge, and West Jackson. The UWMP adopts the findings and results of the WSIP, and presents the population growth projection in 5-year interval from 2020 to 2040. Note that buildout is projected to occur after 2040 in Zone 40. The 5-year interval population projection is shown in Table 2 below (or Table 3-2 of the UWMP).

With the population projection and the established GPCD target, the UWMP estimates the water demands for SCWA’s service areas in 5-year increments for the 20-year projection (2020 to 2040), as shown in Table 4-3 of the UWMP. A summary of the pertinent data from these tables is presented in Table 3 below.

<sup>1</sup> Population developed in the WSIP (SCWA, 2016). The UWMP also identifies Zone 40 as Laguna Vineyard and Mather-Sunrise system. The more commonly used subarea names are used in this document: North Service Area, Central Service Area, and South Service Area. The proposed project is located in the South Service Area of Zone 40.

<sup>2</sup> Metro Air Park and Northgate 880 customers are non-residential and have no population associated with them.

<sup>3</sup> Total Current population in 2015 was provided in the UWMP. The population for each service area was not quantified separately using DWR population pool.

The water demands for single dry and multiple dry water years are provided in Table 4. The water supply allocation from the CVP supply in 2015 was a historical low. The CVP allocation for the three-year period from 2013 to 2015 was also the lowest historical three year sequence. The UWMP (Table 7-1 of UWMP) identifies 2013 as an average year and 2015 as a single dry
year. For the drought period 2013-2015, 2013 is identified as the first year of multiple-dry years, 2014 as the second year, and 2015 as the third year.

IDENTIFY EXISTING WATER SUPPLIES FOR THE PROJECT [Section 10910(d)]

SECTION 10910(d)(1)

Section 10910(d)(1) requires identification of existing water supply entitlements, water rights, or water service contracts relevant to the identified water supply for the proposed Project and a description of the quantities of water obtained by SCWA pursuant to these water supply entitlements, water rights, or water service contracts in previous years.

Use of Groundwater

The Project water demands, as part of the Zone 40 water demand, will ultimately be met by conjunctive use of groundwater and surface water and a small portion of recycled water, as described in the WSMP and UWMP. SCWA currently exercises, and will continue to exercise,
its rights as a groundwater appropriator to extract groundwater from the groundwater basin (Central Basin) underlying Zone 40 for delivery to its customers\(^1\).

SCWA has a remediated groundwater supply of 8,900 AF/Year in accordance with the terms and conditions in the agreement entitled “Agreement between Sacramento County, SCWA, and Aerojet-General Corporation with Respect to Transfer of GET Water” dated May 18, 2010. This remediated groundwater supply is diverted by SCWA from the Sacramento River at Freeport along with SCWA’s surface water supplies.

A bigger portion of groundwater is used in the CSA and SSA of Zone 40. There is also some groundwater pumping in other SCWA service areas outside of Zone 40. The UWMP has identified SCWA’s groundwater availability in the next 20 years, as shown in Table 6 (see Table 6-12 of UWMP).

<table>
<thead>
<tr>
<th>Use of Surface Water</th>
</tr>
</thead>
<tbody>
<tr>
<td>The SCWA conjunctive use program includes the delivery of surface water within the Zone 40 boundaries as part of a comprehensive program to maintain the long-term, regional balance of the groundwater basin (see WSMP). The UWMP uses the terms “purchased water” and “surface water” to describe surface water supply. DWR defines purchased water as water purchased from other suppliers, including non-self supplied surface water. Surface water is defined by DWR as self-supplied water that is drawn from streams, lakes, and reservoirs.</td>
</tr>
</tbody>
</table>

- **Purchased Water**
  SCWA has two sources of purchased surface water supplies, as described below.

  **1. Central Valley Project**

  The Central Valley Project (CVP) water supply consists of the CVP contracts held by SCWA. One contract, referred to as the “SMUD” contract, is for 30,000 AFA. Most of the CVP water is diverted at the Freeport diversion on the Sacramento River and treated at the Vineyard SWTP. Occasionally, some of the CVP supplies are diverted

\(^1\) The groundwater basin underlying Zone 40 has not been adjudicated.
from the Sacramento River and treated at the City’s Sacramento River Surface Water Treatment Plant and delivered to SCWA at the Franklin Intertie.

SCWA entered into a contract in April 1999 with the Reclamation for 15,000 AF/Year of CVP supplies pursuant to Public Law (PL) 101-514. This contract is often referred to as “Fazio Water” in recognition of the efforts by Congressman Vic Fazio to secure this contract. The 15,000 AF/Year is available for SCWA through the Freeport diversion or Franklin Intertie.

SCWA’s total CVP supply is subject to reductions in dry years. The water supply allocations are defined by Reclamation on a year to year basis and are expressed as a percentage of either the contract amount or amount of average use. For the 21 year period of 1995 to 2015, the lowest allocation was in 2015 when it reduced to Health and Safety levels of 55-gallons per capita per day. Due to SCWA’s abundant groundwater supplies, SCWA took no CVP water with that allocation.

The water supply allocations are based on a draft policy that defines water shortage terms and conditions. Reclamation initiated the development of a Municipal and Industrial (M&I) Water Shortage Policy in 1992, with several proposals prepared through 2001. The 2001 draft water shortage policy states that Reclamation would reduce M&I water to a contractor once irrigation water allocations are reduced below 75 percent of the contract amount. Reclamation has a provision in the draft policy for a minimum M&I shortage allocation of 75 percent that is applied to the last three years of historical use with certain adjustments, although the actual allocation in 2014 was 75 percent and in 2015 it was 25 percent of the use during the previous three unconstrained years ultimately ending with Health and Safety levels. In 2010, Reclamation convened several workshops that will lead to the development of an Environmental Impact Statement that could potentially modify the existing policy or develop a new policy (US, 2011). This process has not been completed.

2. City of Sacramento’s American River Place of Use Water Supply

A portion of Zone 40 lies within the City of Sacramento’s American River Place of Use (POU). The City of Sacramento has a pre-1914 water right to the American River with a POU boundary that extends beyond the City’s boundary and includes a portion of Zone 40. The amount of water available to serve the POU area within Zone 40 is estimated to be 9,300 AF/Year. SCWA is planning for the future wholesale delivery of American River water within the POU. A connection would be constructed to supply the portion of Zone 40 in the POU area, with the timing based on when the supply is actually needed.

The City of Sacramento’s diversions from the American River at the Fairbairn Water Treatment Plant are reduced when American River flows are less than the Hodge Flow Criteria, which would likely result in no POU water being available for SCWA in these circumstances. The City of Sacramento may decide to divert water during
these restricted times at their Sacramento River diversion, although additional infrastructure might need to be constructed by the City of Sacramento to be able to convey this water to SCWA. It might be possible for SCWA to divert the POU water at the Freeport diversion. Given the uncertainty of the availability of POU water during dry periods, a supply allocation of zero percent is assumed for dry years and 100 percent for normal climate years.

- **Surface Water Rights**

SCWA has an appropriative water supply that is self-supplied surface water that is drawn from the Sacramento River. In February 2008, the State Water Resources Control Board (SWRCB) approved SCWA’s appropriative right permit application to divert water from the American and Sacramento Rivers (Permit 21209). The amount of appropriated water available for use could range up to 71,000 AF/Year in wet years, primarily during the winter months. This water would be diverted at the Freeport diversion on the Sacramento River and the City’s Sacramento diversion structure. Since SCWA’s demands are low in the winter months, it is possible that not all of this supply could be utilized without the ability to store the water.

Contract documents, agreements, and applications for appropriative water and CVP water supplies are available for review. **Table 7** (see **Table 6-12** in UWMP) shows all the surface water entitlements, water rights, and water services contracts to meet the build-out water demand.

**Table 7**

- **Recycled Water**

  A small amount of recycled water is being used in the SSA of Zone 40 for public landscape irrigation, such as parks, schools, commercial, and streetscapes. In 2015 the recycled water use was 575 AF/Year. Recycled water use is projected to increase to 1,700 AF/Year after 2020 (see Table 4-6 of UWMP).

**SECTION 10910(d)(2)**

Section 10910(d)(2) requires SCWA to demonstrate that water supplies required to serve the Project actually exist. Section 10910(d)(2) defines what constitutes “proof.”

**Section 10910(d)(2)(A)**

This subsection requires written contracts or other proof of entitlement to the water supplies identified for the Project. The contracts and agreements for the surface water supplies are available for review at the offices of the County of Sacramento, Department of Water Resources.

Initial water demands in the Project will be met predominantly with groundwater. SCWA will exercise its right as a groundwater appropriator to extract groundwater from the basin for delivery to the Project; surface water will be from existing entitlements diverted from the Sacramento River and treated at the VSWTP. In the long-term, the water demands of the Project will be met in accordance with the conjunctive use program described in the WSMP.
**Section 10910(d)(2)(B)**
This subsection requires a copy of the capital outlay program for financing the delivery of the identified water supply to the Project. The documents described below are available for review at the offices of the County of Sacramento, Department of Water Resources.

A financing plan for the construction of groundwater and surface water facilities needed to realize the conjunctive use program identified in the WSMP has been approved by SCWA’s Board of Directors (Board). The financing plan, as outlined in Chapter 7 of the WSMP, identifies the necessary water facility projects and estimated costs associated with implementation of said conjunctive use program (Capital Improvement Program or CIP).

In addition to the WSMP, the Feasibility Report for Sacramento County Water Financing Authority Series 2007 Revenue Bonds (Sacramento County Water Agency Freeport Project) (MWH, April 2007), and the Sacramento County Water Agency FY 2009/10 Water Rate Study Report (FCS Group) evaluated and updated the total cost and fee requirements of the Zone 40 conjunctive use program incorporating all future Zone 40 expenditures for major capital facilities (i.e., surface water treatment plants, groundwater treatment plants, major transmission mains, etc.) and annual operation and maintenance costs. Funding to meet SCWA’s capital and annual funding requirements was then implemented by the Board through the issuance of revenue bonds for certain projects and the adoption of user fee and development fee increases over time.

SCWA’s capital outlay program includes the means for financing facilities to deliver the identified water supply to the Project. Specifically, all facilities needed to serve the Project are included in the CIP that was financed through the above described revenue bonds, user fee, and development fee. The development fee and user fee, as described in Titles 3 and 4 of the Sacramento County Water Agency Code, will continue to provide revenue to finance all aspects of the Zone 40 conjunctive use program, including repayment of debt financing. Both fee programs are evaluated annually and adjusted, if necessary, to accommodate changes in the service area, water demands, needed capital projects, and required debt financing. Based on the CIP, a 10-year CIP is annually updated by the Board of Directors.

**Section 10910(d)(2)(C)**
This subsection requires identification of any federal, state, and local permits required for construction of the facilities identified for delivering the water supply to the Project.

Water deliveries to the Project will be made through connecting to the existing T-mains surrounding the Project: 16-inch T-main in West Taron Drive, 16-inch T-main in Harbor Point Drive, and 12-inch T-main in Elk Grove Blvd. Therefore, there is no permit required for the construction of these facilities.

**Section 10910(d)(2)(D)**
This subsection requires identification of any regulatory approvals required for delivery of the water supply to the Project.

Water production, treatment, and storage facilities will be added to SCWA’s public water system permit issued by the California Department of Public Health (DPH) and the design of these...
facilities will require review and approval by DPH. No other regulatory approvals are anticipated.

New water service and discretionary approval of any project may be withheld until compliance with the Endangered Species Act (ESA) is demonstrated. Depending upon the source of water, compliance may be demonstrated by one of the following: participation in the South Sacramento Habitat Conservation Plan (SSHCP); a letter from the US Fish and Wildlife Service (USFWS) to the Project proponent and/or federal agency indicating the Project is not likely to adversely affect or result in a take of listed species; incidental take coverage through a biological opinion for the Project; or, incidental take coverage through an ESA section 10(a)(1)(B) permit for the Project. This requirement may be a condition of approval for any discretionary action taken by the local land use authority.

IDENTIFY PARTIES DEPENDENT UPON PROPOSED SUPPLY [Section 10910(e)]

SECTION 10910(e)

Section 10910(e) states:

“If no water has been received in prior years by the public water system..., under the existing water supply entitlements, water rights, or water service contracts [identified to serve the proposed project], the public water system,...shall also include in its water supply assessment pursuant to subdivision (c), an identification of the other public water systems or water service contract holders that receive a water supply or have existing water supply entitlements, water rights, or water service contracts to the same source of water as the public water system,..., has identified as a source of water supply within its water supply assessments.”

The intent of this section is to identify any potential conflicts that may arise from the exercise of a water supply entitlement, water right, or water service contract to serve a proposed project if such water supply entitlement, water right, or water service contract has not been previously exercised.

Use of Groundwater
The water demands of Zone 40 (including the Project) will be met with groundwater and surface water. SCWA has previously exercised its rights as a groundwater appropriator to meet the water demands of its customers and will continue to exercise those rights to provide treated groundwater supplies to the Project.

Use of Surface Water
The surface water supplies associated with SCWA’s conjunctive use program fall into three categories:

1) Purchased water supplies available through a current USBR CVP contract.
2) Purchased water available through the City of Sacramento for use within the American River Place of Use (POU).
3) Water supplies available through SWRCB Permit 21209.
For USBR CVP purchased water and SWRCB Permit 21209 surface water, the parties that could most directly be affected are other CVP contractors, State Water Project (SWP) contractors, water rights holders subject to Term 91 conditions, and riparian diverters downstream of SCWA’s point of diversion. The point of diversion is at a site near the community of Freeport on the Sacramento River.

The source of POU water supply is wholesale water from the City of Sacramento to serve the area that lies within the POU. Delivery of this water to SCWA has been included in the City of Sacramento’s long-range plan for perfecting their American River water rights. The diversion location, timing, and volume of delivery are currently under negotiation.

DOES SUPPLY FOR PROJECT INCLUDE GROUNDWATER? [Section 10190(f)]

SECTION 10910(f)
As stated earlier, the water supply for Zone 40 (including the Project) include groundwater. Section 10910(f) requires additional information about groundwater to be presented in this WSA.

Section 10910(f)(1)
Section 10910(f)(1) requires a review of groundwater information contained in the UWMP relevant to the identified water supply for the Project. Section 6.3 of UWMP provides a description of the applicable groundwater basins, the status of groundwater management, overdraft conditions, historical groundwater pumping, and the remediated groundwater supply.

Section 10910(f)(2)
Section 10910(f)(2) requires a description of the groundwater basin and the efforts being taken to prevent long-term overdraft.

• South American Subbasin (5-21.65)

For the Project, SCWA would pump groundwater from the South American Sub-basin as defined by the California Department of Water Resources (DWR) Bulletin 118. According to Bulletin 118, the South American Sub-basin is defined as the area bounded on the west by Interstate 5 and the Sacramento River, on the north by the American River, on the south by the Cosumnes and Mokelumne rivers and on the east by the Sierra Nevada. The Central Basin covers a major portion of this basin.

Groundwater in the Central Basin is generally classified as occurring in a shallow aquifer (Laguna or Modesto Formation) and in a deep aquifer (Mehrten Formation). The Laguna or Modesto Formation consists of older alluvial deposits of loosely to moderately compacted sand, silt, and gravel deposited in alluvial fans. These deposits are moderately permeable and have a thickness of about 100 to 650 feet. The deeper Mehrten Formation is a sequence of fragmented volcanic rocks which crops out in a discontinuous band along the eastern margin of the basin. It is composed of black volcanic sands, stream gravels, silt, and clay inter-bedded with intervals of dense tuff breccia. The sand and gravel intervals are highly permeable and the tuff breccia
Intensive use of groundwater over the past 60 years has resulted in a general lowering of groundwater elevations. Over time, isolated groundwater depressions have grown and coalesced into a single cone of depression that is centered in the southwestern portion of the basin, approximately 15 miles southwest of the project site. Groundwater level trends through much of the basin have generally declined consistently from the 1950s and 1960s to about 1980 by 20 to 30 feet. From 1980 through 1983, water levels recovered by about 10 feet and remained stable until the beginning of the 1987-1992 drought; however, wells in the vicinity of Rancho Cordova appear to have recovered less than other wells in the basin since 1995 (generally less than 10 feet). From 1995 to 2003 most groundwater levels recovered to levels that were generally higher than levels prior to the 1987 through 1992 drought. Much of this recovery can be attributed to the increased use of surface water in the Central Basin, and the falling of previously irrigated agricultural lands transitioning into new urban development areas. In the central portion of the Central Basin, where the Project site is located, groundwater level trends observed in California Department of Water Resources monitoring wells generally vary between 40 feet above to 40 feet below mean sea level over the period of the 1950’s through the 2000’s.

Recharge of the aquifer system occurs along active river and stream channels where extensive sand and gravel deposits exist, particularly along the American, Cosumnes, and Sacramento rivers. Additional recharge occurs along the eastern boundary of Sacramento County at the transition point from the consolidated rocks of the Sierra Nevada to the alluvial-deposited basin sediments. This recharge is classified as subsurface recharge along with underground flow into and out of the basin with adjacent groundwater basins. Other sources of recharge include deep percolation from applied surface water and precipitation.

As mentioned previously, the estimated long term annual sustainable yield of groundwater from the Central Basin is 273,000 AF/year. The determination of the sustainable yield of the Central Basin (273,000 acre-feet per year) was negotiated by the Water Forum Groundwater Negotiating Team (GWNT) and involved a complex process that developed the long-term average annual pumping limit of the basin. The long-term average annual pumping limit is described as the hydro-geologic process under which groundwater can be pumped and not exceed average natural recharge over a long-term period of time. Under sustainable conditions, natural recharge is said to be able to make up for variations in the amount of pumping that occurs over the long-term, given wet and dry periods in the hydrologic record.

First, the GWNT developed future land and water use projections. Then the impacts associated with increased water demands, assuming that demand is met solely by groundwater, were described. These results were then compared with 1990 baseline conditions to provide the level of impact that could be expected if groundwater pumping were increased beyond baseline conditions.

Four quantifiable factors were used to determine the level of impact:
1) Water quality degradation
2) Dewatering of wells
3) Higher cost of pumping
4) Ground subsidence

Based on these four factors, a series of groundwater model runs quantified each condition in 10-year increments, beginning in 1990 and ending in 2030. Each model run was set up to reflect future land and water use conditions; then 70 years of historical hydrology were applied to each model run to determine how the aquifer might behave under wet and dry conditions.

After comprehensive review and analysis of the resulting data, the GWNT concluded that using 2005 levels of groundwater pumping (interpolated from the 2000 and 2010 modeling results) would provide the highest quantity of groundwater yield from the basin while minimizing impacts associated with the four factors of concern. Accordingly, the GWNT determined the 2005 pumping rates equated to a long-term pumping average annual pumping limit of approximately 273,000 acre-feet per year for the Central Basin.

- SCWA Conjunctive Use Program

Section 3.2 and Appendix E of the WSMP provide detailed descriptions of the Zone 40 conjunctive use program. SCWA’s operational approach for preventing overdraft of the groundwater basin underlying Zone 40 and optimizing the use of both groundwater and surface water is discussed in detail in these sections. The FEIR for 2002 Zone 40 Water Supply Master Plan includes an extensive analysis of the effects of the Zone 40 conjunctive use program on the groundwater basin and on various recharge sources. A summary of the conjunctive use program is as follows:

SCWA’s conjunctive use program is a coordinated approach to manage surface water and groundwater supplies to maximize the yield of available water resources. The conjunctive use program for SCWA includes the use of groundwater, surface water, remediated water, and recycled water supplies. The program also includes the construction of a surface water diversion structure, a surface-water treatment plant, and water conveyance pipelines, as well as groundwater extraction, treatment, and distribution facilities.

This conjunctive use program relies on an abundance of surface water in wet years when as much surface water as possible will be diverted, within entitlement limitations, minimizing the use of groundwater. During these years the groundwater aquifer will be allowed to naturally replenish. In dry years, when surface water availability is reduced, SCWA will pump more groundwater from the replenished aquifer. Using surface water and groundwater conjunctively makes it easier for SCWA to meet demands in a single dry year or in multiple dry years. The goal of the conjunctive use program is to meet all demands during wet and dry years.

SCWA has adopted policies to insure systematic, incremental implementation of its conjunctive use program. These policies are also consistent with the terms of the WFA, which is intended to maintain a long-term sustainable groundwater supply. The policies are included in the SCWA’s UWMP and WSMP, which include specific action items to assure implementation. Action items
include development of additional surface water supply and treatment facilities to provide water during wet years, development of groundwater facilities to provide groundwater during dry years, in-lieu “banking” of groundwater during wet years, development and implementation of demand management and water conservation strategies, development of water reclamation facilities to meet non-potable demands, and development of a financing plan to implement these action items.

- **Groundwater Management Plan (GMP)**

As a part of the Groundwater Authority, SCWA has committed to the implementation of the Central Basin GMP. The Central Basin GMP contains five Basin Management Objectives (BMOs) designed to maintain a safe, sustainable and high quality groundwater resource within the Central Basin. These BMOs, in conjunction with the program component action items, focus on managing and monitoring the basin to benefit all groundwater users in the basin and are intended to be specific enough to result in numerical criteria for the basin, but also flexible enough to be modified or adapted to new information on groundwater basin behavior over time. The five BMOs are summarized below:

1. Maintain the long-term average groundwater extraction rate at or below 273,000 acre-feet per year.
2. Maintain specific groundwater elevations within all areas of the basin consistent with the Water Forum “solution.”
3. Protect against any potential inelastic land surface subsidence by limiting subsidence to no more than 0.007 feet per 1 foot of drawdown in the groundwater basin.
4. Protect against any adverse impacts to surface water flows in the American, Cosumnes and Sacramento rivers.
5. Water quality objectives:
   a. Total Dissolved Solids (TDS) concentration of less than 1,000 milligrams per liter (mg/l).
   b. Nitrate (NO₃) concentration of less than 45 mg/l.
   c. Volatile Organic Compounds (VOC).

The Groundwater Authority intends to achieve these objectives by implementing the following program component action items:

1. Stakeholder involvement; including public outreach, involving other agencies inside and adjacent to the basin, developing relationships with state and federal agencies, and pursuing partnership opportunities.
2. Monitoring program; including groundwater elevation monitoring, groundwater quality monitoring, land surface elevation monitoring, surface water/groundwater interaction monitoring, establishing protocols for collection of groundwater data, and establishing a data management system.
3. Groundwater resource protection; including well construction policies, well abandonment and destruction policies, wellhead protection measures, protection of recharge areas, control of the migration and remediation of contaminated groundwater, and control of saline water intrusion.
4. Groundwater sustainability; including demand reduction.
5. Planning integration; including existing integrated planning efforts, urban water management planning, Drinking Water Source Assessment and Protection (DWSAP) program, land use planning, and integrated groundwater and surface water modeling.

The Central Basin GMP also has an implementation plan that defines specific actions or trigger points and associated remedy activities linked with each of the BMOs. Once a trigger point has been reached, the Groundwater Authority must decide on a course of action.

Water quality analysis of the aquifers underlying the Central Basin has shown that groundwater quality found in the upper aquifer system is of higher quality than that found in the lower aquifer system. This is principally because the lower aquifer system (specifically the Mehrten Formation) contains higher concentrations of iron and manganese and higher concentrations of total dissolved solids (TDS). Notwithstanding these findings, the lower aquifer typically meets water quality standards as a potable water source. Water from the upper aquifer (specifically the Laguna Formation) generally does not require treatment, unless high arsenic values are encountered, other than disinfection for public drinking water systems.

- Sustainable Groundwater Management Act (SGMA)

The Sustainable Groundwater Management Act (SGMA) was enacted by the legislature in 2014, with subsequent amendments in 2015. SGMA requires groundwater management in priority groundwater basins, which includes the formation of Groundwater Sustainability Agencies (GSAs) and the development of Groundwater Sustainability Plans (GSPs) for groundwater basins or subbasins that are designated by DWR as medium or high priority.

The designation of the priority of groundwater basins was done as part of the California Statewide Groundwater Elevation Monitoring (CASGEM) Program. CASGEM was developed in response to legislation enacted in California's 2009 Comprehensive Water package. The CASGEM Groundwater Basin Prioritization is a statewide ranking of groundwater basin importance that incorporates groundwater reliance and focuses on basins producing greater than 90 percent of California's annual groundwater. The CASGEM Program has ranked the South American Subbasin (5-21.65) as high priority.

SGMA directs DWR to identify groundwater basins and subbasins in conditions of critical overdraft. DWR identified such basins in Bulletin-118, 1980 and Bulletin 118, Update 2003. DWR issued an updated draft list of critically over drafted basins in July 2015. The South American subbasin is not on this list.

Groundwater basins designated as high or medium priority and identified as critically over-drafted must be managed under GSPs, adjudications, or alternatives by January 31, 2020. All other high and medium priority basins not identified as critically over-drafted must be managed under a GSP by January 31, 2022. The South American subbasin that supplies SCWA’s Zone 40 is covered by the latter deadline.
Currently SCGA is in discussions with other groundwater basin users of the South American Subbasin (5-21.65) to evaluate options for GSA formation and GSP development for SGMA compliance.

**Section 10910(f)(3)**

Section 10910(f)(3) requires a description of the volume and geographic distribution of groundwater extractions from the basin for the last five years.

**Table 9** (see UWMP Table 6-2) identifies past volumes of groundwater extracted by SCWA in Zone 40 between 2011 –2015.

Through the water supply master planning process, SCWA identified a system of sixteen separate well fields throughout Zone 40. A distributed groundwater extraction strategy was selected because it would minimize drawdown effects of pumping by spreading extraction over a wide geographic area. The approximate locations of the SCWA’s current and future well fields is shown in **Figure 3**.

Section 10910(f)(4)
Section 10910(f)(4) requires a description of the projected volume and geographic distribution of groundwater extractions from the basin.

Groundwater use has declined since the VSWTP has come online, but it will increase over time as water demand continues to grow in Zone 40. In wet and normal years, groundwater pumping will be minimized because surface water becomes the major water supply source. In dry years, groundwater pumping will increase significantly as surface water availability is considerably reduced. Table 6 identifies projected potential maximum groundwater pumping necessary to meet Zone 40’s water demands from 2020-2040.
Figure 3  Existing and Future Well Fields in SCWA Zone 40
**Section 10910(f)(5)**

Section 10910(f)(5) requires an analysis of the sufficiency of the groundwater basin to meet the demands associated with the Project.

The WFA defined a long-term sustainable average annual yield of 273,000 AF/year for the Central Basin and provided for SCWA’s groundwater needs as identified in the WSMP. The WSMP describes a conjunctive use program that identifies and projects a long-term average use of groundwater to meet identified water demands, including the demand associated with the Project.

SCWA’s conjunctive use program has been extensively analyzed and documented in the WSMP, the FEIR for 2002 WSMP (certified in February 2006), the FEIR – WFA (certified in 1999), and the WFA. All referenced documents have been subjected to thorough technical peer review and public scrutiny.

**DETERMINATION OF SUFFICIENCY**

SCWA determines that it has identified sufficient water supplies to meet the water demands of the Project over the next 20 years during normal, single dry, and multiple dry years.

SCWA makes this determination based on the information provided in this WSA and on the following specific facts:

- SCWA’s conjunctive use program is a sustainable water supply program that provides a 100-percent reliable water supply while protecting environmental values and stabilizing the groundwater basin underlying Zone 40.
- SCWA’s conjunctive use program has been extensively analyzed and documented in the WSMP, the FEIR for 2002 WSMP (certified in February 2006), the FEIR – WFA (certified in 1999), and the WFA. All referenced documents have been subjected to thorough technical peer review and public scrutiny.
- The Project will be served by water supplies made available through SCWA’s conjunctive use program.
- A financing plan for SCWA’s conjunctive use program for constructing facilities required for delivering groundwater and surface water to the Project has been approved by the Board through its adoption of the WSMP, Bond Feasibility Reports, and the Sacramento County Water Agency Code.

The UWMP demonstrates that SCWA’s total projected water supplies during normal, single dry, and multiple dry water years meet the proposed water demands over the next 20 years, as shown in Table 10.

CONCLUSION

This WSA documents all required information specifically delineated by Water Code Sections 10910 – 10915. It demonstrates that SCWA’s water supplies are sufficient to satisfy the water demands of the currently proposed Project while still meeting the current and projected water demands of existing customers in the next 20 years. If there are significant changes to land uses for the proposed project in the future, this WSA may need to be revisited and updated accordingly.
To: Board of Directors  
Sacramento County Water Agency

Through: Navdeep S. Gill, County Executive

From: Michael Peterson, Director, Department of Water Resources

Subject: Approval Of Water Supply Assessment For California Northstate University Medical Center In The City Of Elk Grove (Continued From September 24, 2019; Item No. 36)

District(s): Nottoli

**RECOMMENDED ACTION**

Approve the California Northstate University Medical Center Water Supply Assessment (WSA), as presented on September 24, 2019, demonstrating its water supplies are sufficient to meet the proposed project demands in addition to existing and previously identified future demands for a period of 20 years.

**BACKGROUND**

No new material is associated with today's item. Please refer to the September 24, 2019 Item No. 36 for the complete set of materials.

RECOMMENDED ACTION  
Approve the attached California Northstate University Medical Center Water Supply Assessment (WSA) demonstrating its water supplies are sufficient to meet the proposed project demands in addition to existing and previously identified future demands for a period of 20 years.  

BACKGROUND  
The California Water Code (Water Code) requires coordination between land use agencies and public water purveyors to ensure that water supplies are adequate to meet existing and planned future demands. Land use lead agencies are subject to Water Code sections 10910 through 10915, which require that the applicable water provider prepare a WSA demonstrating its water supplies are sufficient to meet the proposed project demands for a period of 20 years.  

The Water Code also requires that specific information be included in the WSA and that the governing body of the public water system approve the WSA at a regular or special meeting. This specific information presented in the WSA includes 1) California Environmental Quality Act (CEQA) discussion; 2) identification of the appropriate public water system; 3) determination if the Urban Water Management Plan (UWMP) includes project water demands; 4) identification of existing water supplies for the project; 5) identification of dependency on proposed water supplies; and 6) determination of the project’s need for groundwater.  

The City of Elk Grove has requested the Sacramento County Water Agency (SCWA) produce a WSA for the California Northstate University Medical Center development (Medical Center WSA) in accordance with the Water Code. The Medical Center WSA (Attachment 1) was prepared by SCWA staff
and is being submitted to the SCWA Board of Directors for approval. The Medical Center WSA demonstrates that SCWA water supply will meet project water demands for the next 20-years per the Water Code requirements.

**FINANCIAL ANALYSIS**
Approval of this assessment will not result in any fiscal impact or obligation to SCWA.
